Engine management
Crankshaft speed sensor

PRODUCT BENEFITS
- High accuracy and large temperature range
- Robust design for long lifetime
- Wide air gap range
- Non-contacting measurement
- Helps to reduce emissions and fuel consumption

1. Electrical interface (connector)
2. Mounting flange
3. Measuring unit
**TASK**

The electronic engine management enables precise, central control of all functions relevant for engine operation. This control is based on ongoing, exact information from the drivetrain. This information is provided by sensors. The crankshaft speed sensor measures the speed, position and, optionally, the rotational direction of the crankshaft. This data is used by engine management systems for controlling injection and/or ignition timing. The crankshaft speed sensor supports compliance with emission regulations as well as increased driving comfort due to smoother engine operation.

**FUNCTION**

The sensor is a Hall or inductive sensor. The crankshaft is fitted with a target wheel which the sensor scans using a non-contacting method. The reference point is determined by a missing element in the target wheel.

**Start-stop functionality**

via direction detection. Helps reduce fuel consumption and CO₂ emissions.

**TECHNICAL CHARACTERISTICS**

<table>
<thead>
<tr>
<th></th>
<th>Active</th>
<th>Inductive</th>
</tr>
</thead>
<tbody>
<tr>
<td>Functional principle</td>
<td>differential Hall with or without direction detection</td>
<td>inductive</td>
</tr>
<tr>
<td>Temperature range</td>
<td>-40 to +150 °C</td>
<td>-40 to +130 °C</td>
</tr>
<tr>
<td>Air gap</td>
<td>0.2 – 1.8 mm</td>
<td>0.3 – 1.8 mm</td>
